**CONTRACT AWARD - DUNN STREET ENABLING WORKS, GLASGOW**

**Civil Engineering Division** is very pleased to have the opportunity to work for Clyde Gateway Developments Limited again, with the award of a package of site enabling works in the east end of Glasgow.

The 14 week project will see the consolidation of two underlying coal seams by rotary percussive drilling and bulk infill with grout. The blue line on the image below shows the area of influence of the proposed consolidation. We shall also clear the site and form perimeter screening bunds as well as retaining the perimeter treeline. All underground structures will be excavated, crushed, screened and spread on the site for future re-use. On completion of the works, the site will be regraded to levels suitable for the succeeding development.

Our methodology will incorporate measures to minimise disturbance to our residential and commercial neighbours. We shall also take care to avoid any damage to the extensive underground services in the surrounding footpaths, or to the brick-lined air vent associated with the disused tunnel under London Road to the north of the site.

The project, designed for the client by AECOM, will begin in late October.
