Civil Engineering Division are delighted to announce their success in being awarded Works Package 201 at the Queens Quay development in Clydebank, Glasgow. We undertook an extremely competitive tender process for this prestigious project, however, our quality submission and detailed knowledge of the works and site played a significant part in securing the contract.

Our renewed presence on site follows two previous successful contracts for Clyde Regeneration Limited, a public private consortium set up to regenerate the site. The historic site was formerly the John Brown shipyard and birthplace of many famous ships including The Queen Mary, Queen Elizabeth and the QE2.

The contract and construction works will commence in late May for a period of 40 weeks. The works include deep drainage under tidal influence and in difficult ground conditions, 1km of new carriageway, multi utility services, district heating installation, a sewage pumping station with box culverted storage, alterations to the existing road network at the tie in points and new traffic signal systems. The hard and soft landscaping works are to a very high standard of finish including an 800m2 section of imprinted concrete with an exposed aggregate finish.
