CONTRACT AWARD – WHEATLEY HALL ROAD PHASE 1

Civil Engineering Division is delighted to report that we have been awarded the Wheatley Hall Road Phase 1 remediation works in Doncaster. The design and build project is for Harworth Estates Ltd and follows on from the successful project delivered at Amplify Earthworks Phase 2 in Rotherham.

Works commenced on site in early September 2017 following the finalisation of the design and remediation strategy. The site is a 45 ha former tractor manufacturing plant and has contamination such as asbestos, hydrocarbons and heavy metals. Phase 1 involves remediation and earthworks to 4.5 ha to facilitate the construction of two commercial units prior to further development for commercial and residential use.

The works will involve demolition of the existing asphalt car parks and concrete building hard standings, as well as localised vegetation and drainage removal. All excavated material is to be processed on site for reuse as the capping layer prior to handover for the commercial development. A site access road, with associated foul and surface water drainage, utilities, street lighting and a substation will also form part of the Phase 1 redevelopment.

The project is a fantastic opportunity to cement our relationship with this client as they seek to develop the remainder of the site which has been earmarked for extensive regeneration with outline planning in place for 800 homes and over 200,000 sq. ft of commercial space.

The project will run through until December 2017 and is in accordance with ICC 6th Edition.
